# Chapter 1

## OpenCTM API Reference

### 1.1 Introduction

OpenCTM is an open file format for storing compressed triangle meshes. In order to easily read and write OpenCTM files (usually suffixed .ctm) an API (Application Program Interface) is provided that can easily be used from most modern programming languages.

The OpenCTM functionality itself is written in highly portable standard C (C99).

### 1.2 Usage

For information about how to use the OpenCTM API, see [openctm.h](#).

For information about the C++ wrapper classes, see [CTMImporter](#) and [CTMExporter](#).

### 1.3 Example usage

#### 1.3.1 Loading a CTM file

Here is a simple example of loading a CTM file:

```
CTMcontext context;
CTMuint vertCount, triCount, * indices;
CTMfloat * vertices;

// Create a new context
context = ctmNewContext(CTM_IMPORT);

// Load the OpenCTM file
ctmLoad(context, "mymesh.ctm");
if(ctmGetError(context) == CTM_NONE)
{
    // Access the mesh data
    vertCount = ctmGetInteger(context, CTM_VERTEX_COUNT);
    vertices = ctmGetFloatArray(context, CTM_VERTICES);
    triCount = ctmGetInteger(context, CTM_TRIANGLE_COUNT);
    indices = ctmGetIntegerArray(context, CTM_INDICES);

    // Deal with the mesh (e.g. transcode it to our internal representation)
    // ...
}

// Free the context
ctmFreeContext(context);
```

### 1.3.2 Creating a CTM file

Here is a simple example of creating a CTM file:

```
CTMcontext context;
CTMuint    vertCount, triCount, * indices;
CTMfloat    * vertices;

// Create our mesh in memory
vertCount = 100;
triCount = 120;
vertices = (CTMfloat *) malloc(3 * sizeof(CTMfloat) * vertCount);
indices = (CTMuint *) malloc(3 * sizeof(CTMuint) * triCount);
// ...

// Create a new context
context = ctmNewContext(CTM_EXPORT);

// Define our mesh representation to OpenCTM (store references to it in
// the context)
ctmDefineMesh(context, vertices, vertCount, indices, triCount, NULL);

// Save the OpenCTM file
ctmSave(context, "mymesh.ctm");

// Free the context
ctmFreeContext(context);

// Free our mesh
free(indices);
free(vertices);
```

## Chapter 2

# Hierarchical Index

### 2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

CTMexporter . . . . .	10
CTMimporter . . . . .	14
std::exception	
ctm_error . . . . .	9

## Chapter 3

# Class Index

### 3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">ctm_error</a>	OpenCTM exception . . . . .	9
<a href="#">CTMexporter</a>	OpenCTM exporter class . . . . .	10
<a href="#">CTMimporter</a>	OpenCTM importer class . . . . .	14

# Chapter 4

## File Index

### 4.1 File List

Here is a list of all files with brief descriptions:

<a href="#">openctm.h</a> . . . . .	19
<a href="#">openctmpp.h</a> . . . . .	41

## Chapter 5

# Class Documentation

### 5.1 `ctm_error` Class Reference

OpenCTM exception.

```
#include <openctmpp.h>
```

Inheritance diagram for `ctm_error`:

#### Public Member Functions

- `ctm_error` (`CTMenum aError`)
- virtual const char \* `what` () const throw ()
- `CTMenum error_code` () const throw ()

#### 5.1.1 Detailed Description

OpenCTM exception.

When an error occurs, a `ctm_error` exception is thrown. Its `what()` function returns the name of the OpenCTM error code (for instance "CTM\_INVALID\_OPERATION").

#### 5.1.2 Constructor & Destructor Documentation

##### 5.1.2.1 `ctm_error()`

```
ctm_error::ctm_error (  
    CTMenum aError) [inline], [explicit]
```

### 5.1.3 Member Function Documentation

#### 5.1.3.1 error\_code()

```
CTMenum ctm_error::error_code () const throw ( )    [inline]
```

#### 5.1.3.2 what()

```
virtual const char * ctm_error::what () const throw ( )    [inline], [virtual]
```

The documentation for this class was generated from the following file:

- [openctmpp.h](#)

## 5.2 CTMexporter Class Reference

OpenCTM exporter class.

```
#include <openctmpp.h>
```

## 5.2.1 Detailed Description

OpenCTM exporter class.

This is a C++ wrapper class for an OpenCTM export context. Usage example:

```
void MySaveFile(CTMuint aVertCount, CTMuint aTriCount, CTMfloat * aVertices,
    CTMuint * aIndices, const char * aFileName)
{
    // Create a new OpenCTM exporter object
    CTMexporter ctm;

    // Define our mesh representation to OpenCTM (store references to it in
    // the context)
    ctm.DefineMesh(aVertices, aVertCount, aIndices, aTriCount, NULL);

    // Save the OpenCTM file
    ctm.Save(aFileName);
}
```

## 5.2.2 Constructor & Destructor Documentation

### 5.2.2.1 CTMexporter() [1/2]

```
CTMexporter::CTMexporter () [inline]
```

Constructor.

### 5.2.2.2 ~CTMexporter()

```
CTMexporter::~~CTMexporter () [inline]
```

Destructor.

### 5.2.2.3 CTMexporter() [2/2]

```
CTMexporter::CTMexporter (
    const CTMexporter & v)
```

## 5.2.3 Member Function Documentation

### 5.2.3.1 AddAttribMap()

```
CTMenum CTMexporter::AddAttribMap (
    const CTMfloat * aAttribValues,
    const char * aName) [inline]
```

Wrapper for [ctmAddAttribMap\(\)](#)

### 5.2.3.2 AddUVMap()

```
CTMenum CTMexporter::AddUVMap (
    const CTMfloat * aUVCoords,
    const char * aName,
    const char * aFileName) [inline]
```

Wrapper for [ctmAddUVMap\(\)](#)

### 5.2.3.3 AttribPrecision()

```
void CTMexporter::AttribPrecision (
    CTMenum aAttribMap,
    CTMfloat aPrecision) [inline]
```

Wrapper for [ctmAttribPrecision\(\)](#)

### 5.2.3.4 CompressionLevel()

```
void CTMexporter::CompressionLevel (
    CTMuint aLevel) [inline]
```

Wrapper for [ctmCompressionLevel\(\)](#)

### 5.2.3.5 CompressionMethod()

```
void CTMexporter::CompressionMethod (
    CTMenum aMethod) [inline]
```

Wrapper for [ctmCompressionMethod\(\)](#)

### 5.2.3.6 DefineMesh()

```
void CTMexporter::DefineMesh (
    const CTMfloat * aVertices,
    CTMuint aVertexCount,
    const CTMuint * aIndices,
    CTMuint aTriangleCount,
    const CTMfloat * aNormals) [inline]
```

Wrapper for [ctmDefineMesh\(\)](#)

### 5.2.3.7 FileComment()

```
void CTMexporter::FileComment (
    const char * aFileComment) [inline]
```

Wrapper for [ctmFileComment\(\)](#)

### 5.2.3.8 NormalPrecision()

```
void CTMexporter::NormalPrecision (
    CTMfloat aPrecision) [inline]
```

Wrapper for [ctmNormalPrecision\(\)](#)

### 5.2.3.9 operator=()

```
CTMexporter & CTMexporter::operator= (
    const CTMexporter & v)
```

### 5.2.3.10 Save()

```
void CTMexporter::Save (
    const char * aFileName) [inline]
```

Wrapper for [ctmSave\(\)](#)

### 5.2.3.11 SaveCustom()

```
void CTMexporter::SaveCustom (
    CTMwritefn aWriteFn,
    void * aUserData) [inline]
```

Wrapper for [ctmSaveCustom\(\)](#)

### 5.2.3.12 UVCoordPrecision()

```
void CTMexporter::UVCoordPrecision (
    CTMenum aUVMap,
    CTMfloat aPrecision) [inline]
```

Wrapper for [ctmUVCoordPrecision\(\)](#)

### 5.2.3.13 VertexPrecision()

```
void CTMexporter::VertexPrecision (
    CTMfloat aPrecision) [inline]
```

Wrapper for [ctmVertexPrecision\(\)](#)

### 5.2.3.14 VertexPrecisionRel()

```
void CTMexporter::VertexPrecisionRel (
    CTMfloat aRelPrecision) [inline]
```

Wrapper for [ctmVertexPrecisionRel\(\)](#)

The documentation for this class was generated from the following file:

- [openctmpp.h](#)

## 5.3 CTMImporter Class Reference

OpenCTM importer class.

```
#include <openctmpp.h>
```

### Public Member Functions

### 5.3.1 Detailed Description

OpenCTM importer class.

This is a C++ wrapper class for an OpenCTM import context. Usage example:

```
// Create a new OpenCTM importer object
CTMImporter ctm;

// Load the OpenCTM file
ctm.Load("mymesh.ctm");

// Access the mesh data
vertCount = ctm.GetInteger(CTM_VERTEX_COUNT);
vertices = ctm.GetFloatArray(CTM_VERTICES);
triCount = ctm.GetInteger(CTM_TRIANGLE_COUNT);
indices = ctm.GetIntegerArray(CTM_INDICES);

// Deal with the mesh (e.g. transcode it to our internal representation)
// ...
```

## 5.3.2 Constructor & Destructor Documentation

### 5.3.2.1 CTMImporter() [1/2]

```
CTMImporter::CTMImporter () [inline]
```

Constructor.

### 5.3.2.2 ~CTMImporter()

```
CTMImporter::~~CTMImporter () [inline]
```

Destructor.

### 5.3.2.3 CTMImporter() [2/2]

```
CTMImporter::CTMImporter (  
    const CTMImporter & v)
```

## 5.3.3 Member Function Documentation

### 5.3.3.1 GetAttribMapFloat()

```
CTMfloat CTMImporter::GetAttribMapFloat (  
    CTMenum aAttribMap,  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetAttribMapFloat\(\)](#)

### 5.3.3.2 GetAttribMapString()

```
const char * CTMImporter::GetAttribMapString (  
    CTMenum aAttribMap,  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetAttribMapString\(\)](#)

### 5.3.3.3 GetFloat()

```
CTMfloat CTMImporter::GetFloat (  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetFloat\(\)](#)

#### 5.3.3.4 GetFloatArray()

```
const CTMfloat * CTMImporter::GetFloatArray (  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetFloatArray\(\)](#)

#### 5.3.3.5 GetInteger()

```
CTMuint CTMImporter::GetInteger (  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetInteger\(\)](#)

#### 5.3.3.6 GetIntegerArray()

```
const CTMuint * CTMImporter::GetIntegerArray (  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetIntegerArray\(\)](#)

#### 5.3.3.7 GetNamedAttribMap()

```
CTMenum CTMImporter::GetNamedAttribMap (  
    const char * aName) [inline]
```

Wrapper for [ctmGetNamedAttribMap\(\)](#)

#### 5.3.3.8 GetNamedUVMap()

```
CTMenum CTMImporter::GetNamedUVMap (  
    const char * aName) [inline]
```

Wrapper for [ctmGetNamedUVMap\(\)](#)

#### 5.3.3.9 GetString()

```
const char * CTMImporter::GetString (  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetString\(\)](#)

#### 5.3.3.10 GetUVMapFloat()

```
CTMfloat CTMImporter::GetUVMapFloat (  
    CTMenum aUVMap,  
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetUVMapFloat\(\)](#)

#### 5.3.3.11 GetUVMapString()

```
const char * CTMImporter::GetUVMapString (
    CTMenum aUVMap,
    CTMenum aProperty) [inline]
```

Wrapper for [ctmGetUVMapString\(\)](#)

#### 5.3.3.12 Load()

```
void CTMImporter::Load (
    const char * aFileName) [inline]
```

Wrapper for [ctmLoad\(\)](#)

#### 5.3.3.13 LoadCustom()

```
void CTMImporter::LoadCustom (
    CTMreadfn aReadFn,
    void * aUserData) [inline]
```

Wrapper for [ctmLoadCustom\(\)](#)

#### 5.3.3.14 operator=()

```
CTMImporter & CTMImporter::operator= (
    const CTMImporter & v)
```

Data)  
*Save an OpenCTM format file using a custom stream write function.*

## 6.1.1 Macro Definition Documentation

### 6.1.1.1 CTM\_API\_VERSION

```
#define CTM_API_VERSION 0x00000100
```

OpenCTM API version (1.0).

### 6.1.1.2 CTM\_FALSE

```
#define CTM_FALSE 0
```

Boolean FALSE.

### 6.1.1.3 CTM\_TRUE

```
#define CTM_TRUE 1
```

Boolean TRUE.

## 6.1.2 Typedef Documentation

### 6.1.2.1 CTMcontext

```
typedef void* CTMcontext
```

OpenCTM context handle.

### 6.1.2.2 CTMfloat

```
typedef float CTMfloat
```

Single precision floating point type (IEEE 754 32 bits wide).

### 6.1.2.3 CTMint

```
typedef int32_t CTMint
```

Signed integer (32 bits wide).

### 6.1.2.4 CTMreadfn

```
typedef CTMuint (CTMCALL * CTMreadfn) (void *aBuf, CTMuint aCount, void *aUserData)
```

Stream read() function pointer.

#### Parameters

in	<i>aBuf</i>	Pointer to the memory buffer to which data should be read.
in	<i>aCount</i>	The number of bytes to read.
in	<i>aUserData</i>	The custom user data that was passed to the <a href="#">ctmLoadCustom()</a> function.

#### Returns

The number of bytes actually read (if this is less than aCount, it indicates that an error occurred or the end of file was reached before all bytes were read).

### 6.1.2.5 CTMuint

```
typedef uint32_t CTMuint
```

Unsigned integer (32 bits wide).

### 6.1.2.6 CTMwritefn

```
typedef CTMuint (CTMCALL * CTMwritefn) (const void *aBuf, CTMuint aCount, void *aUserData)
```

Stream write() function pointer.

#### Parameters

in	<i>aBuf</i>	Pointer to the memory buffer from which data should be written.
in	<i>aCount</i>	The number of bytes to write.
in	<i>aUserData</i>	The custom user data that was passed to the <a href="#">ctmSaveCustom()</a> function.

#### Returns

The number of bytes actually written (if this is less than aCount, it indicates that an error occurred).

## 6.1.3 Enumeration Type Documentation

### 6.1.3.1 CTMenum

enum [CTMenum](#)

OpenCTM specific enumerators.

#### Note

For the information query functions, it is an error to query a value of the wrong type (e.g. to query a string value with the [ctmGetInteger\(\)](#) function).

#### Enumerator

CTM_NONE	No error has occurred (everything is OK). Also used as an error return value for functions that should return a CTMenum value.
CTM_INVALID_CONTEXT	The OpenCTM context was invalid (e.g. NULL).
CTM_INVALID_ARGUMENT	A function argument was invalid.
CTM_INVALID_OPERATION	The operation is not allowed.
CTM_INVALID_MESH	The mesh was invalid (e.g. no vertices).
CTM_OUT_OF_MEMORY	Not enough memory to proceed.
CTM_FILE_ERROR	File I/O error.
CTM_BAD_FORMAT	File format error (e.g. unrecognized format or corrupted file).
CTM_LZMA_ERROR	An error occurred within the LZMA library.
CTM_INTERNAL_ERROR	An internal error occurred (indicates a bug).
CTM_UNSUPPORTED_FORMAT_VERSION	Unsupported file format version.
CTM_IMPORT	The OpenCTM context will be used for importing data.
CTM_EXPORT	The OpenCTM context will be used for exporting data.
CTM_METHOD_RAW	Just store the raw data.
CTM_METHOD_MG1	Lossless compression (floating point).
CTM_METHOD_MG2	Lossless compression (fixed point).
CTM_VERTEX_COUNT	Number of vertices in the mesh (integer).
CTM_TRIANGLE_COUNT	Number of triangles in the mesh (integer).
CTM_HAS_NORMALS	CTM_TRUE if the mesh has normals (integer).
CTM_UV_MAP_COUNT	Number of UV coordinate sets (integer).
CTM_ATTRIB_MAP_COUNT	Number of custom attribute sets (integer).
CTM_VERTEX_PRECISION	Vertex precision - for MG2 (float).
CTM_NORMAL_PRECISION	Normal precision - for MG2 (float).
CTM_COMPRESSION_METHOD	Compression method (integer).
CTM_FILE_COMMENT	File comment (string).
CTM_NAME	Unique name (UV/attrib map string).
CTM_FILE_NAME	File name reference (UV map string).
CTM_PRECISION	Value precision (UV/attrib map float).
CTM_INDICES	Triangle indices (integer array).
CTM_VERTICES	Vertex point coordinates (float array).
CTM_NORMALS	Per vertex normals (float array).
CTM_UV_MAP_1	Per vertex UV map 1 (float array).
CTM_UV_MAP_2	Per vertex UV map 2 (float array).

## Enumerator

CTM_UV_MAP_3	Per vertex UV map 3 (float array).
CTM_UV_MAP_4	Per vertex UV map 4 (float array).
CTM_UV_MAP_5	Per vertex UV map 5 (float array).
CTM_UV_MAP_6	Per vertex UV map 6 (float array).
CTM_UV_MAP_7	Per vertex UV map 7 (float array).
CTM_UV_MAP_8	Per vertex UV map 8 (float array).
CTM_ATTRIB_MAP_1	Per vertex attribute map 1 (float array).
CTM_ATTRIB_MAP_2	Per vertex attribute map 2 (float array).
CTM_ATTRIB_MAP_3	Per vertex attribute map 3 (float array).
CTM_ATTRIB_MAP_4	Per vertex attribute map 4 (float array).
CTM_ATTRIB_MAP_5	Per vertex attribute map 5 (float array).
CTM_ATTRIB_MAP_6	Per vertex attribute map 6 (float array).
CTM_ATTRIB_MAP_7	Per vertex attribute map 7 (float array).
CTM_ATTRIB_MAP_8	Per vertex attribute map 8 (float array).

## 6.1.4 Function Documentation

### 6.1.4.1 ctmAddAttribMap()

```
CTMEXPORT CTMenum CTMCALL ctmAddAttribMap (
    CTMcontext aContext,
    const CTMfloat * aAttribValues,
    const char * aName)
```

Define a custom vertex attribute map.

Custom vertex attributes can be used for defining special per-vertex attributes, such as color, weight, ambient occlusion factor, etc.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aAttribValues</i>	An array of attribute values. Each attribute value is made up by four consecutive floats, and there must be as many values as there are vertices in the mesh.
in	<i>aName</i>	A unique name for this attribute map (zero terminated UTF-8 string).

## Returns

A attribute map index (CTM\_ATTRIB\_MAP\_1 and higher). If the function failed, it will return the zero valued CTM\_NONE (use [ctmGetError\(\)](#) to determine the cause of the error).

## Note

A triangle mesh must have been defined before calling this function, since the number of vertices is defined by the triangle mesh.

## See also

[ctmDefineMesh\(\)](#).

### 6.1.4.2 ctmAddUVMap()

```
CTMEXPORT CTMenum CTMCALL ctmAddUVMap (
    CTMcontext aContext,
    const CTMfloat * aUVCoords,
    const char * aName,
    const char * aFileName)
```

Define a UV map.

There can be several UV maps in a mesh. A UV map is typically used for 2D texture mapping.

#### Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aUVCoords</i>	An array of UV coordinates. Each UV coordinate is made up by two consecutive floats, and there must be as many coordinates as there are vertices in the mesh.
in	<i>aName</i>	A unique name for this UV map (zero terminated UTF-8 string).
in	<i>aFileName</i>	A reference to a image file (zero terminated UTF-8 string). If no file name reference exists, pass NULL.

#### Returns

A UV map index (CTM\_UV\_MAP\_1 and higher). If the function failed, it will return the zero valued CTM\_NONE (use [ctmGetError\(\)](#) to determine the cause of the error).

#### Note

A triangle mesh must have been defined before calling this function, since the number of vertices is defined by the triangle mesh.

#### See also

[ctmDefineMesh\(\)](#).

### 6.1.4.3 ctmAttribPrecision()

```
CTMEXPORT void CTMCALL ctmAttribPrecision (
    CTMcontext aContext,
    CTMenum aAttribMap,
    CTMfloat aPrecision)
```

Set the attribute value precision for the specified attribute map (only used by the MG2 compression method).

#### Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aAttribMap</i>	An attribute map specifier for a defined attribute map (CTM_ATTRIB_MAP_1, ...).
in	<i>aPrecision</i>	Fixed point precision. For instance, if this value is 0.001, all attribute values will be rounded to three decimals. If the attributes represent integer values, set the precision to 1.0. The default attribute precision is $2^{-8} \approx 0.0039$ .

#### See also

[ctmAddAttribMap\(\)](#).

#### 6.1.4.4 ctmCompressionLevel()

```
CTMEXPORT void CTMCALL ctmCompressionLevel (
    CTMcontext aContext,
    CTMuint aLevel)
```

Set which LZMA compression level to use for the given OpenCTM context.

The compression level can be between 0 (fastest) and 9 (best). The higher the compression level, the more memory is required for compression and decompression. The default compression level is 1.

##### Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aLevel</i>	Which compression level to use (0 to 9).

#### 6.1.4.5 ctmCompressionMethod()

```
CTMEXPORT void CTMCALL ctmCompressionMethod (
    CTMcontext aContext,
    CTMenum aMethod)
```

Set which compression method to use for the given OpenCTM context.

The selected compression method will be used when calling the [ctmSave\(\)](#) function.

##### Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aMethod</i>	Which compression method to use: CTM_METHOD_RAW, CTM_METHOD_MG1 or CTM_METHOD_MG2 (the default method is CTM_METHOD_MG1).

##### See also

[CTM\\_METHOD\\_RAW](#), [CTM\\_METHOD\\_MG1](#), [CTM\\_METHOD\\_MG2](#)

#### 6.1.4.6 ctmDefineMesh()

```
CTMEXPORT void CTMCALL ctmDefineMesh (
    CTMcontext aContext,
    const CTMfloat * aVertices,
    CTMuint aVertexCount,
    const CTMuint * aIndices,
    CTMuint aTriangleCount,
    const CTMfloat * aNormals)
```

Define a triangle mesh.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aVertices</i>	An array of vertices (three consecutive floats make one vertex).
in	<i>aVertexCount</i>	The number of vertices in <i>aVertices</i> (and optionally <i>aTexCoords</i> ).
in	<i>aIndices</i>	An array of vertex indices (three consecutive integers make one triangle).
in	<i>aTriangleCount</i>	The number of triangles in <i>aIndices</i> (there must be exactly 3 x <i>aTriangleCount</i> indices in <i>aIndices</i> ).
in	<i>aNormals</i>	An array of per-vertex normals (or NULL if there are no normals). Each normal is made up by three consecutive floats, and there must be <i>aVertexCount</i> normals.

## See also

[ctmAddUVMMap\(\)](#), [ctmAddAttribMap\(\)](#), [ctmSave\(\)](#), [ctmSaveCustom\(\)](#).

## 6.1.4.7 ctmErrorString()

```
CTMEXPORT const char *CTMCALL ctmErrorString (
    CTMenum aError)
```

Converts an OpenCTM error code to a zero-terminated string.

## Parameters

in	<i>aError</i>	An OpenCTM error code, as returned by <a href="#">ctmGetError()</a> .
----	---------------	---

## Returns

A zero terminated string that describes the error. For instance, if *aError* is CTM\_INVALID\_OPERATION, then the return value will be "CTM\_INVALID\_OPERATION".

## See also

[CTMenum](#)

## 6.1.4.8 ctmFileComment()

```
CTMEXPORT void CTMCALL ctmFileComment (
    CTMcontext aContext,
    const char * aFileComment)
```

Set the file comment for the given OpenCTM context.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aFileComment</i>	The file comment (zero terminated UTF-8 string).

## 6.1.4.9 ctmFreeContext()

```
CTMEXPORT void CTMCALL ctmFreeContext (
    CTMcontext aContext)
```

Free an OpenCTM context.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
----	-----------------	---

## See also

[ctmNewContext\(\)](#)

## 6.1.4.10 ctmGetAttribMapFloat()

```
CTMEXPORT CTMfloat CTMCALL ctmGetAttribMapFloat (
    CTMcontext aContext,
    CTMenum aAttribMap,
    CTMenum aProperty)
```

Get information about a vertex attribute map.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aAttribMap</i>	Which vertex attribute map to query (CTM_ATTRIB_MAP_1 or higher).
in	<i>aProperty</i>	Which vertex attribute map property to return.

## Returns

A floating point value, representing the vertex attribute map property given by *aProperty*.

## See also

[CTMenum](#)

## 6.1.4.11 ctmGetAttribMapString()

```
CTMEXPORT const char *CTMCALL ctmGetAttribMapString (
    CTMcontext aContext,
    CTMenum aAttribMap,
    CTMenum aProperty)
```

Get information about a vertex attribute map.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aAttribMap</i>	Which vertex attribute map to query (CTM_ATTRIB_MAP_1 or higher).
in	<i>aProperty</i>	Which vertex attribute map property to return.

**Returns**

A string value, representing the vertex attribute map property given by `aProperty`.

**Note**

The string is only valid as long as the vertex attribute map within the OpenCTM context is valid. Trying to access an invalid string will result in undefined behaviour. Therefore it is recommended that the string is copied to a new variable if it is to be used other than directly after the call to `ctmGetAttribMapString()`.

**See also**

[CTMenum](#)

**6.1.4.12 ctmGetError()**

```
CTMEXPORT CTMenum CTMCALL ctmGetError (
    CTMcontext aContext)
```

Returns the latest error.

Calling this function will return the last produced error code, or CTM\_NO\_ERROR (zero) if no error has occurred since the last call to `ctmGetError()`. When this function is called, the internal error variable will be reset to CTM\_↔ NONE.

**Parameters**

in	<i>aContext</i>	An OpenCTM context that has been created by <code>ctmNewContext()</code> .
----	-----------------	--

**Returns**

An OpenCTM error code.

**See also**

[CTMenum](#)

**6.1.4.13 ctmGetFloat()**

```
CTMEXPORT CTMfloat CTMCALL ctmGetFloat (
    CTMcontext aContext,
    CTMenum aProperty)
```

Get information about an OpenCTM context.

**Parameters**

in	<i>aContext</i>	An OpenCTM context that has been created by <code>ctmNewContext()</code> .
in	<i>aProperty</i>	Which property to return.

**Returns**

A floating point value, representing the OpenCTM context property given by `aProperty`.

**See also**

[CTMenum](#)

#### 6.1.4.14 ctmGetFloatArray()

```
CTMEXPORT const CTMfloat *CTMCALL ctmGetFloatArray (
    CTMcontext aContext,
    CTMenum aProperty)
```

Get a floating point array from an OpenCTM context.

##### Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aProperty</i>	Which array to return.

##### Returns

A floating point array. If the requested array does not exist, or if *aProperty* does not indicate a float array, the function returns NULL.

##### Note

The array is only valid as long as the OpenCTM context is valid, or until the corresponding array changes within the OpenCTM context. Trying to access an invalid array will result in undefined behaviour. Therefore it is recommended that the array is copied to a new variable if it is to be used other than directly after the call to [ctmGetFloatArray\(\)](#).

##### See also

[CTMenum](#)

#### 6.1.4.15 ctmGetInteger()

```
CTMEXPORT CTMuint CTMCALL ctmGetInteger (
    CTMcontext aContext,
    CTMenum aProperty)
```

Get information about an OpenCTM context.

##### Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aProperty</i>	Which property to return.

##### Returns

An integer value, representing the OpenCTM context property given by *aProperty*.

##### See also

[CTMenum](#)

#### 6.1.4.16 ctmGetIntegerArray()

```
CTMEXPORT const CTMuint *CTMCALL ctmGetIntegerArray (
    CTMcontext aContext,
    CTMenum aProperty)
```

Get an integer array from an OpenCTM context.

**Parameters**

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aProperty</i>	Which array to return.

**Returns**

An integer array. If the requested array does not exist, or if `aProperty` does not indicate an integer array, the function returns NULL.

**Note**

The array is only valid as long as the OpenCTM context is valid, or until the corresponding array changes within the OpenCTM context. Trying to access an invalid array will result in undefined behaviour. Therefore it is recommended that the array is copied to a new variable if it is to be used other than directly after the call to [ctmGetIntegerArray\(\)](#).

**See also**

[CTMenum](#)

**6.1.4.17 ctmGetNamedAttribMap()**

```
CTMEXPORT CTMenum CTMCALL ctmGetNamedAttribMap (
    CTMcontext aContext,
    const char * aName)
```

Get a reference to the named vertex attribute map.

**Parameters**

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aName</i>	The name of the attribute map that should be returned.

**Returns**

A reference to an attribute map. If the attribute map was found, a value of `CTM_ATTRIB_MAP_1` or higher is returned, otherwise `CTM_NONE` is returned.

**6.1.4.18 ctmGetNamedUVMap()**

```
CTMEXPORT CTMenum CTMCALL ctmGetNamedUVMap (
    CTMcontext aContext,
    const char * aName)
```

Get a reference to the named UV map.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aName</i>	The name of the UV map that should be returned.

## Returns

A reference to a UV map. If the UV map was found, a value of CTM\_UV\_MAP\_1 or higher is returned, otherwise CTM\_NONE is returned.

**6.1.4.19 ctmGetString()**

```
CTMEXPORT const char *CTMCALL ctmGetString (
    CTMcontext aContext,
    CTMenum aProperty)
```

Get information about an OpenCTM context.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aProperty</i>	Which property to return.

## Returns

A string value, representing the OpenCTM context property given by *aProperty*.

## Note

The string is only valid as long as the OpenCTM context is valid, or until the corresponding string changes within the OpenCTM context (e.g. calling [ctmFileComment\(\)](#) invalidates the CTM\_FILE\_COMMENT string). Trying to access an invalid string will result in undefined behaviour. Therefore it is recommended that the string is copied to a new variable if it is to be used other than directly after the call to [ctmGetString\(\)](#).

## See also

[CTMenum](#)

**6.1.4.20 ctmGetUVMapFloat()**

```
CTMEXPORT CTMfloat CTMCALL ctmGetUVMapFloat (
    CTMcontext aContext,
    CTMenum aUVMap,
    CTMenum aProperty)
```

Get information about a UV map.

**Parameters**

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aUVMap</i>	Which UV map to query (CTM_UV_MAP_1 or higher).
in	<i>aProperty</i>	Which UV map property to return.

**Returns**

A floating point value, representing the UV map property given by *aProperty*.

**See also**

[CTMenum](#)

**6.1.4.21 ctmGetUVMapString()**

```
CTMEXPORT const char *CTMCALL ctmGetUVMapString (
    CTMcontext aContext,
    CTMenum aUVMap,
    CTMenum aProperty)
```

Get information about a UV map.

**Parameters**

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aUVMap</i>	Which UV map to query (CTM_UV_MAP_1 or higher).
in	<i>aProperty</i>	Which UV map property to return.

**Returns**

A string value, representing the UV map property given by *aProperty*.

**Note**

The string is only valid as long as the UV map within the OpenCTM context is valid. Trying to access an invalid string will result in undefined behaviour. Therefore it is recommended that the string is copied to a new variable if it is to be used other than directly after the call to [ctmGetUVMapString\(\)](#).

**See also**

[CTMenum](#)

**6.1.4.22 ctmLoad()**

```
CTMEXPORT void CTMCALL ctmLoad (
    CTMcontext aContext,
    const char * aFileName)
```

Load an OpenCTM format file into the context.

The mesh data can be retrieved with the various [ctmGet](#) functions.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aFileName</i>	The name of the file to be loaded.

**6.1.4.23 ctmLoadCustom()**

```
CTMEXPORT void CTMCALL ctmLoadCustom (
    CTMcontext aContext,
    CTMreadfn aReadFn,
    void * aUserData)
```

Load an OpenCTM format file using a custom stream read function.

The mesh data can be retrieved with the various ctmGet functions.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aReadFn</i>	Pointer to a custom stream read function.
in	<i>aUserData</i>	Custom user data, which can be a C language FILE handle, C++ istream object, or a custom object pointer of any type. The user data pointer will be passed to the custom stream read function.

## See also

[CTMreadfn](#).

**6.1.4.24 ctmNewContext()**

```
CTMEXPORT CTMcontext CTMCALL ctmNewContext (
    CTMenum aMode)
```

Create a new OpenCTM context.

The context is used for all subsequent OpenCTM function calls. Several contexts can coexist at the same time.

## Parameters

in	<i>aMode</i>	An OpenCTM context mode. Set this to CTM_IMPORT if the context will be used for importing data, or set it to CTM_EXPORT if it will be used for exporting data.
----	--------------	--

## Returns

An OpenCTM context handle (or NULL if no context could be created).

**6.1.4.25 ctmNormalPrecision()**

```
CTMEXPORT void CTMCALL ctmNormalPrecision (
    CTMcontext aContext,
    CTMfloat aPrecision)
```

Set the normal precision (only used by the MG2 compression method).

The normal is represented in spherical coordinates in the MG2 compression method, and the normal precision controls the angular and radial resolution.

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aPrecision</i>	Fixed point precision. For the angular information, this value represents the angular precision. For the radial information, this value is the linear resolution. For instance, 0.01 means that the circle is divided into 100 steps, and the normal magnitude is rounded to 2 decimals. The default normal precision is $2^{-8} \approx 0.0039$ .

**6.1.4.26 ctmSave()**

```
CTMEXPORT void CTMCALL ctmSave (
    CTMcontext aContext,
    const char * aFileName)
```

Save an OpenCTM format file.

The mesh must have been defined by [ctmDefineMesh\(\)](#).

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aFileName</i>	The name of the file to be saved.

**6.1.4.27 ctmSaveCustom()**

```
CTMEXPORT void CTMCALL ctmSaveCustom (
    CTMcontext aContext,
    CTMwritefn aWriteFn,
    void * aUserData)
```

Save an OpenCTM format file using a custom stream write function.

The mesh must have been defined by [ctmDefineMesh\(\)](#).

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aWriteFn</i>	Pointer to a custom stream write function.
in	<i>aUserData</i>	Custom user data, which can be a C language FILE handle, C++ ostream object, or a custom object pointer of any type. The user data pointer will be passed to the custom stream write function.

## See also

[CTMwritefn](#).

**6.1.4.28 ctmUVCoordPrecision()**

```
CTMEXPORT void CTMCALL ctmUVCoordPrecision (
    CTMcontext aContext,
    CTMenum aUVMap,
    CTMfloat aPrecision)
```

Set the coordinate precision for the specified UV map (only used by the MG2 compression method).

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aUVMap</i>	A UV map specifier for a defined UV map (CTM_UV_MAP_1, ...).
in	<i>aPrecision</i>	Fixed point precision. For instance, if this value is 0.001, all UV coordinates will be rounded to three decimals. The default UV coordinate precision is $2^{-12} \approx 0.00024$ .

## See also

[ctmAddUVMap\(\)](#).

## 6.1.4.29 ctmVertexPrecision()

```
CTMEXPORT void CTMCALL ctmVertexPrecision (
    CTMcontext aContext,
    CTMfloat aPrecision)
```

Set the vertex coordinate precision (only used by the MG2 compression method).

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aPrecision</i>	Fixed point precision. For instance, if this value is 0.001, all vertex coordinates will be rounded to three decimals. The default vertex coordinate precision is $2^{-10} \approx 0.00098$ .

## 6.1.4.30 ctmVertexPrecisionRel()

```
CTMEXPORT void CTMCALL ctmVertexPrecisionRel (
    CTMcontext aContext,
    CTMfloat aRelPrecision)
```

Set the vertex coordinate precision, relative to the mesh dimensions (only used by the MG2 compression method).

## Parameters

in	<i>aContext</i>	An OpenCTM context that has been created by <a href="#">ctmNewContext()</a> .
in	<i>aRelPrecision</i>	Relative precision. This factor is multiplied by the average triangle edge length in the mesh in order to obtain the final, fixed point precision. For instance, if aRelPrecision is 0.01, and the average edge length is 3.7, then the fixed point precision is set to 0.037.

## Note

The mesh must have been defined using the [ctmDefineMesh\(\)](#) function before calling this function.

## See also

[ctmVertexPrecision\(\)](#).
